Investor-Style Pitch Deck Execution Plan

Create a complete investor pitch package for the AI Work Verification and Auto-Invoicing Platform, with separate execution tracks for the internal team and for Cursor/model workflows.

Use this document to guide planning, source collection, deck writing, challenge review, and packaging.

1. Desired Output

The goal is to produce a full investor communication package, not just slide text.

- Investor deck outline
- Investor deck slide copy
- Short and long versions
- Speaker notes
- Metrics worksheet
- Q&A prep
- Demo flow notes
- Cursor prompt pack

Team-Owned Truth

The team owns the facts, numbers, proof, product decisions, investor target, and final strategic judgment.

Cursor-Driven Acceleration

Cursor helps with positioning options, deck structures, wording compression, skeptical review, variants, and support material.

2. Investment Story to Aim For

The company should be framed as **an AI-assisted infrastructure layer between project delivery, time, and billing**, not merely as a feature for invoice automation.

- Services businesses lose margin and trust because work, time, and billing are fragmented

- Verification, auditability, and billing confidence matter more than ever
- AI is useful when combined with auditable rules and system-of-record integrations
- Invoice automation is the wedge; benchmarking and intelligence become the moat

---

3. Recommended Deck Structure

Slide	Purpose
1. Vision	Name, positioning, tagline, and immediate clarity on what the company is building.
2. Problem	Show the fragmentation between PM tools, time logs, and billing systems.
3. Why Now	Explain why AI, workflow pressure, and finance scrutiny make this timely.
4. Solution	Explain verification, invoice validation, and auto-invoicing clearly.
5. Product Walkthrough	Describe the user flow from connect to verify to invoice draft.
6. Market	Show starting wedge and expansion path.
7. Business Model	Explain pricing logic and monetization layers.
8. Traction	Present pilots, conversations, prototype proof, and signals of demand.
9. Go-to-Market	Show how the first customers will be won.
10. Competitive Advantage	Show why this is not a shallow feature.
11. Roadmap	Tell the phase story from MVP to benchmark intelligence.
12. Team	Explain founder credibility and ability to execute.
13. Financial Model	Show business logic and efficiency path.
14. Ask	State raise/use-of-funds if relevant.

---

4. Full Team Execution Plan

TEAM WORKFLOW

Step 1 - Lock the narrative

- Define the exact category or wedge you are entering
- Agree on the strongest pain point to lead with
- Decide what makes the company venture-scale if it works

Step 2 - Choose the investor audience

- Generalist pre-seed
- AI application investors
- Fintech/ops workflow investors
- Vertical SaaS investors

Step 3 - Gather proof

- Customer pain examples
- Prototype screenshots
- Design partner notes
- Pricing assumptions
- Roadmap and integration list
- Founder bios

Step 4 - Build the proof hierarchy

Rank claims by evidence strength. Strongest proof includes paying users, pilots, LOIs, active beta commitments, and measurable prototypes.

Step 5 - Draft the deck in plain text

For each slide define the title, key point, 3 bullets maximum, required visual, and source of proof.

Step 6 - Pressure test the story

Simulate investor pushback around market size, trust, defensibility, and whether the product is a feature or a category-worthy company.

CURSOR / MODEL WORKFLOW

Step 1 - Feed a complete brief

Give Cursor a structured master brief that includes product summary, target customer, Phase 1 scope, traction signals, pricing assumptions, team background, and open questions.

Step 2 - Generate positioning options

- Ask for multiple one-line positioning statements
- Ask for several category framings
- Compare which framing sounds most venture-backable

Step 3 - Generate deck structures

- Create 10-slide, 12-slide, and 14-slide outlines
- Choose the right one for the fundraising stage

Step 4 - Draft each slide in layers

- headline options
- three concise bullets
- visual/chart suggestions
- missing-proof flags
- speaker notes

Step 5 - Run skeptical review passes

Ask Cursor to critique the deck like an investor and rewrite weak lines without inventing new facts.

Step 6 - Create support materials

- Q&A prep
- intro email
- post-meeting note
- one-page memo
- demo script

5. Rules for Working With Cursor

> **Rule:** the team owns the truth, and Cursor owns acceleration.

- Provide facts first and assumptions second
- Ask for options, not a single answer
- Never allow made-up metrics, traction, or market claims
- Use Cursor for sharpening, condensing, reviewing, and adapting to audiences
- Keep the deck business-led, not feature-led

---

6. Division of Responsibilities

Team	Cursor
Strategy, proof, numbers, customer truth, market assumptions, product scope, fundraising logic, and final sign-off.	Rewrite for clarity, create framing options, compress slide copy, run challenge passes, generate Q&A prep, and adapt the story to audience variants.

---

7. Documents to Generate

- Master product brief
- Investor narrative brief
- Proof and traction worksheet
- Slide source sheet
- Investor deck outline
- Investor deck copy draft
- Investor Q&A prep
- Demo flow script
- Cursor prompt pack

---

8. Suggested Execution Sequence

1. Create the master product brief
2. Define the investor narrative
3. Gather proof and metrics
4. Write the text-only deck
5. Use Cursor to sharpen framing and compression
6. Create visuals and charts

7. Run investor objection testing
8. Create short and long versions
9. Finalize speaker notes
10. Package the full pitch kit

---

9. What Makes It Truly Investor-Style

- concise, not overloaded
- proof-led, not adjective-led
- clear on why the market can be large
- clear on why this specific wedge matters first
- clear on why this team can win
- strong on business outcomes, not just features

---

10. Immediate Next Step

Before touching slide design, first finalize three source documents: a master product brief, the team workbook, and the Cursor brief template. Once those are complete, the investor deck can be generated and refined much faster with better quality.
